

ABSTRACT OF THE DISCLOSURE

In order that the outside surfaces of a projector are flat at non-use times of the projector and a control panel is disposed at an upper portion of a projector main body for good operability at the time of using the projector, a front cover provided with a control panel on its back side is turnably supported on the projector main body by double hinge mechanisms, so that the projector as a whole is box-shaped with flat outside surfaces when the front cover is stored in a storage position for covering the front side of a projection lens, and the front cover is directed to the skewly rear upper side of the projector main body when the front cover is turned from the storage position for covering the front side of the projection lens to an open position at an upper portion of the projector main body. Further, in order to secure both good portability of the projector and good acoustic property at the time of using the projector, loudspeakers are incorporated in the front cover so that the loudspeakers are projected at an upper portion of the projector main body when the front cover is moved from the storage position for covering the front side of the projection lens to the upper portion of the projector main body to open the front side of the projection lens.
